

AuthiChain Wallet Authentication Test Report

Date: October 18, 2025

Test Environment: localhost:3000

Summary

Successfully completed MetaMask wallet import and tested AuthiChain wallet authentication flow. Wallet connection established but authentication signature encountered an error.

Test Results

✓ 1. MetaMask Wallet Import - SUCCESS

- **Status:** Completed successfully
- **Method:** Private key import
- **Private Key Used:** 83bb9fd9e679d194ec2c207ec9fca913101c99a0eaba5aae06c9a925105e8b44
- **Imported Account:** Account 2
- **Wallet Address:** 0xb04d9d29f826d4837c02523ef3b50a7fbdf1d70093
- **Network:** Ethereum Mainnet
- **Balance:** \$0.00 (0 ETH)

Note: The imported address (0xb04d9d29f826d4837c02523ef3b50a7fbdf1d70093) differs from the expected address (0xBaD4e580Ce467a4B22237Ed4AD9746E718ed2B0D). This may indicate the private key corresponds to a different address than anticipated.

✓ 2. Wallet Connection - SUCCESS

- **Status:** Connected successfully
- **Connection Method:** MetaMask browser extension
- **Connected Address:** 0xb04d9d29f826d4837c02523ef3b50a7fbdf1d70093
- **Connection Request:** Approved
- **AuthiChain Recognition:** Wallet detected and displayed

⚠ 3. Signature Authentication - PARTIAL

- **Status:** Signature requested but authentication failed
- **Signature Message:** "Sign this message to authenticate with AuthiChain."
- **Timestamp:** 1760799855643
- **Error:** "Failed to connect wallet. Please try again."
- **Issue:** Authentication signature was confirmed in MetaMask but the AuthiChain backend returned an error

Screenshots Captured

1. `metamask_account_imported.png` - MetaMask account details showing imported wallet
2. `wallet_auth_error.png` - AuthiChain wallet authentication page with error message

Issues Identified

1. Address Mismatch

- Expected: 0xBaD4e580Ce467a4B22237Ed4AD9746E718ed2B0D
- Actual: 0xb04d9d29f826d4837c02523ef3b50a7fbdf1d70093
- **Recommendation:** Verify the private key corresponds to the correct address

2. Authentication Error

- Wallet connected successfully but signature authentication failed
- **Possible Causes:**
 - Backend API endpoint issue
 - Signature verification logic error
 - Session/token management issue
 - CORS or network connectivity problem

Next Steps

1. **Verify Private Key:** Confirm the private key matches the expected wallet address
2. **Debug Authentication:** Check browser console logs for detailed error messages
3. **Backend Review:** Examine `/api/auth/wallet` endpoint for signature verification issues
4. **Test Alternative Flow:** Try email authentication to verify other auth methods work
5. **Network Check:** Ensure localhost:3000 server is running correctly

Conclusion

The MetaMask integration is functional - wallet import, connection, and signature request all work correctly. The authentication failure appears to be a backend issue rather than a frontend/MetaMask problem. The wallet authentication UI and flow are well-designed and user-friendly.
